

“TRACE MINERALS USE and DIGESTIVE ISSUES WITH RESULTANT
DIARRHEA”

By Dr. Al Plechner

The use of a premium calcium montmorillinite soothes the intestinal lining of these patients due to the natural chelated kaolin that I found in this natural product that works much better than the manmade chemical kaolin that resides in many anti diarrheal medications for people and animals.

Another interesting property of this premium calcium montmorillinite is that it creates a PH of 8.3 which alkaline.

Normally the PH of the bowel is 6 to 6.5 PH.

What I have found, that is of great interest to me is that the majority of intestinal parasites live in a PH of 6 to 6.5.

In creating an environment of 8.3, by supplementing this natural product, I find that most intestinal parasites cannot live in an alkaline PH and are naturally shed.

It has been proven that the flesh eating bacteria referred to as MRSA, when exposed to this calcium montmorillinite, will die due to the PH changing the environment of these vicious bacteria, and due to this PH change, this antibiotic resistant bacteria can no longer continue to cause catastrophic damage and death to the patient that has been unfortunate enough to contrive this resistant bacteria.

DIARRHEA”

By Dr. Al Plechner

Even with all the different antibiotics, MRSA will continue its destruction, but a change in their PH environment will lead to their demise.

I am hoping this same environmental PH change will affect and purge intestinal parasites.

Unfortunately, this has never been considered before and definitely should be considered now, if you find my thoughts of interest.

This natural premium calcium montmorillinite that I have studied and used for 30 years is called NUTRAMIN for animals and TERRAMIN for people.

I know using this natural chelated calcium montmorillinite will provide all those necessary micronutrients that no longer occur in our foods and our pet foods due to overworked agricultural soils.

This natural product, with its important negative ion, neutralizes toxins, heavy metals and radiation.

This has been proven and can be viewed at www.californiaearthminerals.com.

What I am more interested in, is finding out if you are seeing the shedding of intestinal parasites in your puppy's and your adults.

I have seen spontaneous shedding of most intestinal parasites using NUTRAMIN and if shedding of the parasite has not occurred, the kaolin and chelated trace minerals keep the bowel healed so that normal weight gain and health of the puppy or adult is maintained.

I have also found that a hormone antibody imbalance will further help intestinal parasites to continue to reappear.

This definitely applies to kittens, cats and all animal species.

Based on 30 years of use of calcium montmorillonite with my patients, these are my thoughts that I share with you. I have worked with over 5000 patients that have followed my suggestion of the use of calcium montmorillonite clay and my observations are very encouraging about the importance of trace minerals for our health. Hopefully, others will add to my findings and bring better health to all.
